**Appendix 1 Forces acting on the Bolts**

## **1 Introduction**

This work shows the stress analysis of the *IND System* built by Comet Fans. According to the Customer design requirements, the design will be checked against static and fatigue loads. The verifications were carried out according to the Customer Specification n.383601 Rev.0.

The FE Model of the *IND System* was built based on the CAD 3D model provided by Comet Fans, last version according to the 2D drawing SC 227 FEA IND SYSTEM.

## 2 Software

The Finite Element Model was prepared and the results were analyzed using MSC Patran 2014 pre/post processor, whereas the analyses were performed using MSC Nastran 2013 code.

## 3 FE Model

### 3.1 FE Model description

The FE model, shown in the next figures, is made of:

- 64013 nodes
- 61698 two-dimensional elements (shell elements)
  - 61061 CQUAD4 elements
  - 637 CTRIA3 elements
- 80 one-dimensional CBAR elements
- 192 Multi Point Constraints RBE2

Screw connections were simplified in the FE Model, and they were modeled through a beam element with suitable cross section, whose ends are connected to the shell by rigid elements.

The mesh of both fans, motors and impellers (components not subjected to verification in this work) was simplified, keeping the inertial properties unchanged.

The global size of the mesh is 10mm. In order to apply the *Hot Spot* method for the stress evaluation on the welds, the size of the mesh was reduced near the weld seams.

The global coordinate system used in this work (shown in the figures), is a rectangular Cartesian coordinate system where x axis is the longitudinal train direction, y axis is the transversal train direction and z axis is the vertical direction train. Measure units are millimeter [mm] for lengths, Newton [N] for forces and second [s] for time.

The calculated mass of the FE model is 204.4kg.

MR002 Rev. 2 dated 12/11/2015

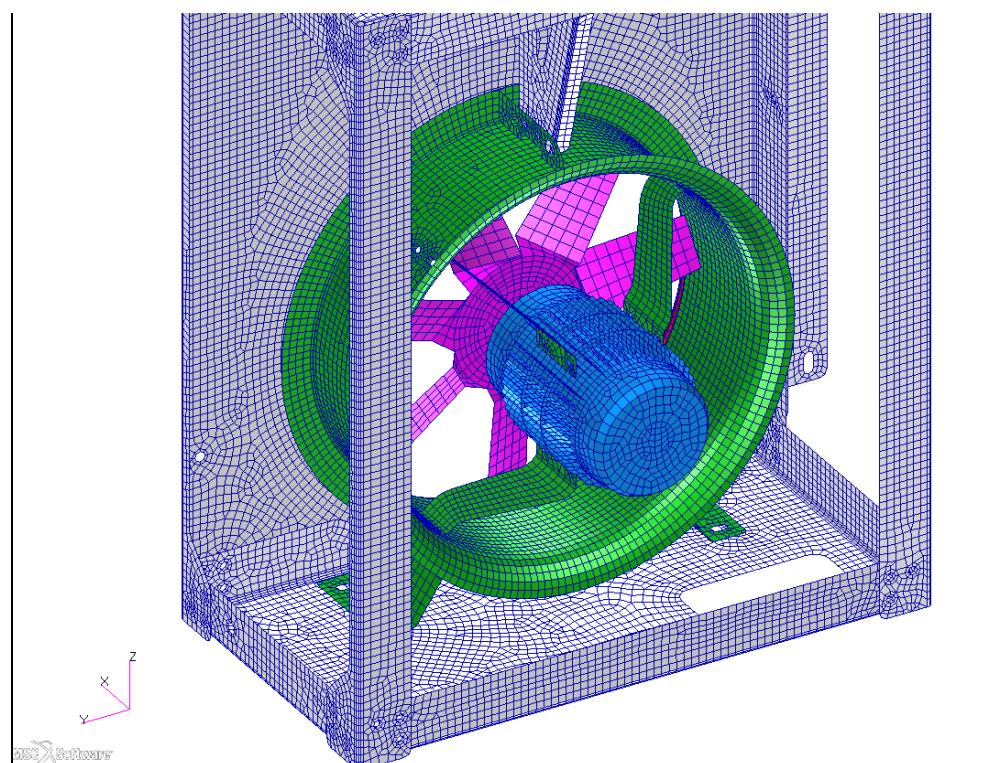

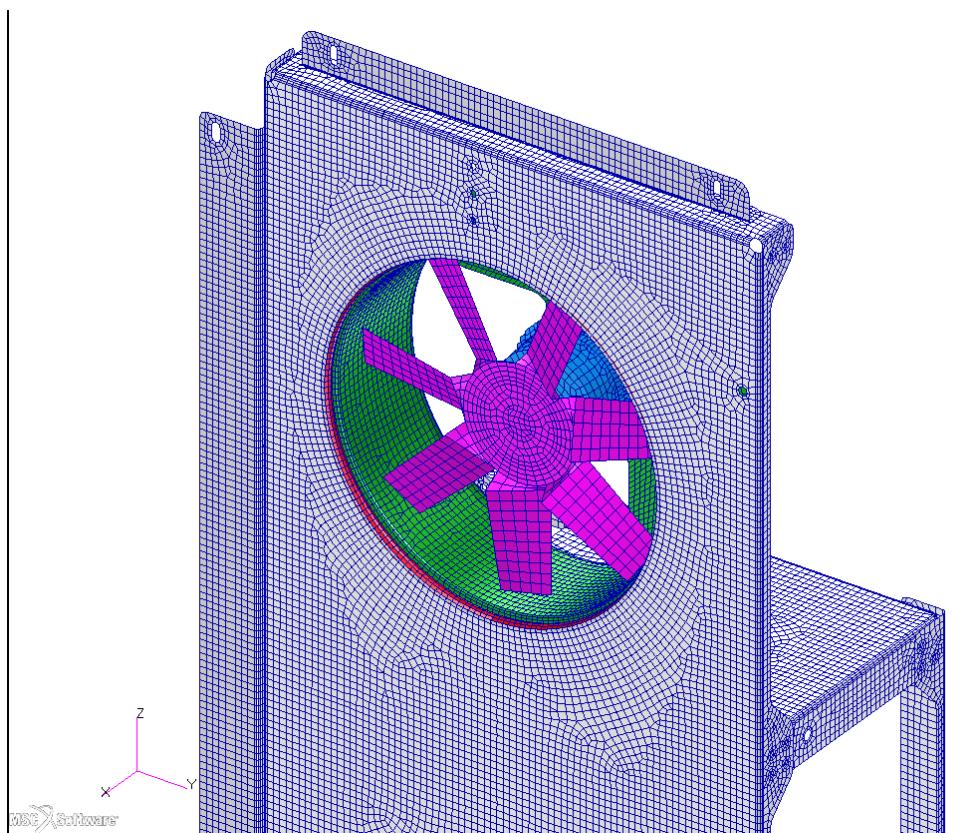

Figure 3.2 – Details of the IND System FE Model

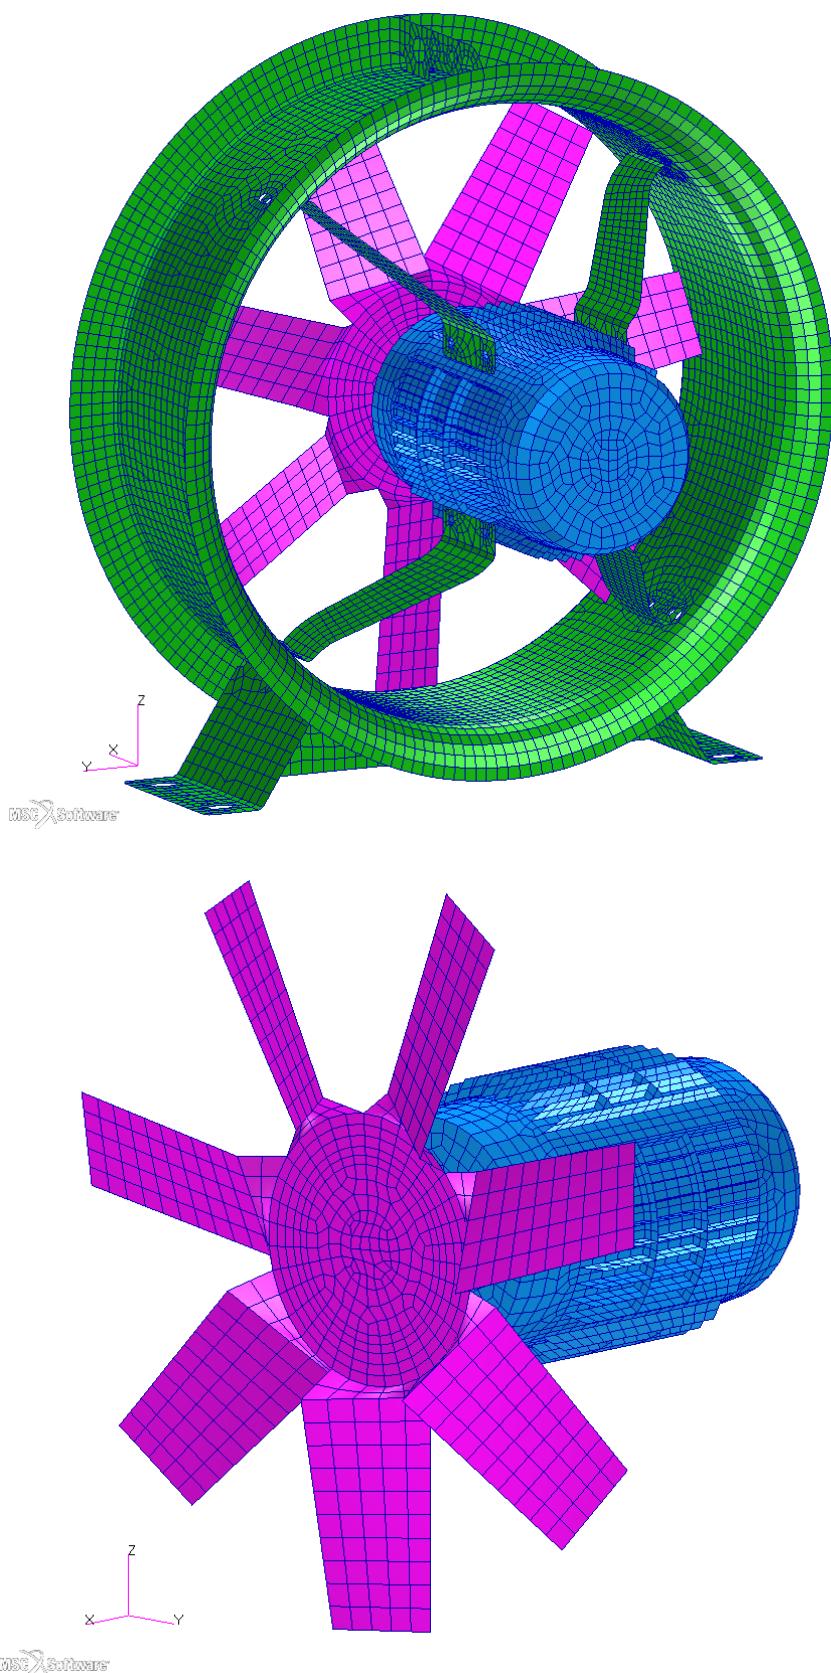

Figure 3.3 – Details of the Impeller and Motor FE Models

### 3.2 Model thickness

The shell thickness of the IND System is shown in the next figure.

Figure 3.4 – IND System shell thickness [mm]

**Technical Report N°1320 - 2015**

MR002 Rev. 2 dated 12/11/2015

### **3.3 FE Model quality check**

Next Table 3.1 shows the results of quality test carried out on the FE model (the elements that exceed the Nastran verification parameters are not in critical areas).

Type Check	Nastran Tolerance	Number of elements over tolerance	% on Total tria3/quad4 shell elements
<b>Skew angle</b>	< 30°	2	< 0,01%
<b>Aspect Ratio</b>	0.5	375	0.6%
<b>Minimum Internal Angle</b>	30°	7	0.01%
<b>Maximum Internal Angle</b>	150°	36	0.05%
<b>Warp Factor</b>	0.05	28	0.04%

Table 3.1 – FE Model check

### **3.4 Material properties**

Materials and related mechanical properties used in the FE model are summarized in Table 3.2.

Component	Material	Yield Strength [MPa]	Ultimate Tensile Strength [MPa]	Young's Modulus [MPa]	Poisson's Ratio	Density [kg/mm <sup>3</sup> ]
Frame Ducts Impeller Fan frame	S355MC	355	510	206000	0.3	7.9e-6
Motor	Cast Iron	-	-	120000	0.3	7.3e-6
Gasket	EPDM	-	-	10	0.4	1.0e-6

Table 3.2 – Material properties

## 4 Allowable stress values

### 4.1 Static loads

According to EN12663 and Customer Specification n.383601 Rev.0, the allowable stress values for the static loads (the same for welds and base material) are shown in the Table 4.1.

<b>Static Loads Allowable Stress</b>	<b>S355 MC</b>
Yield strength ( $R_{p0.2}/1.15$ )	308 MPa

Table 4.1 – Allowable stress for the static loads

### 4.2 Fatigue loads

The verification for the fatigue loads was carried out according to EN 1993-1-9 standard Annex B (*Fatigue resistance using the geometric - hot spot - stress method*).

The Fatigue Class (FAT, i.e. fatigue limit @  $2 \times 10^6$  cycles) and the allowable stress values (stress range) @  $10^7$  cycles for all details are summarized in the next table (a safety factor of 1.35 was considered).

<b>Fatigue Loads Allowable Stress (stress range)</b> @ $1e7$ cycles – Safety factor $\xi=1.35$			
<b>Material</b>	<b>Detail</b>	<b>FAT</b>	<b>Stress Range</b>
S355 MC	Base material	160	76.0
	Fillet weld	90	42.8

Table 4.2 – Allowable stress for the fatigue loads

Next figures show the fatigue curves for all considered details.

## Technical Report N°1320 - 2015

MR002 Rev. 2 dated 12/11/2015

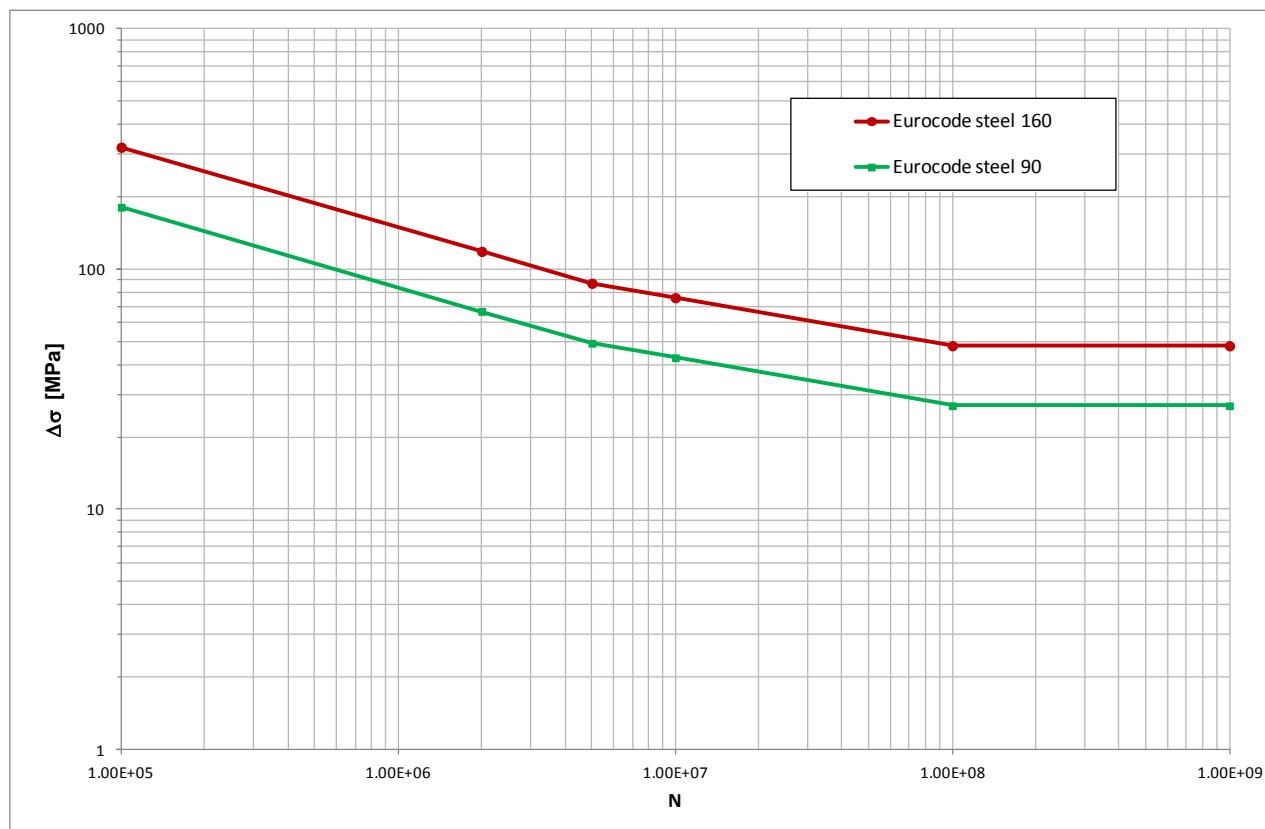

Figure 4.1 – Allowable fatigue strength for steel details (safety factor = 1.35)

Detail category	Constructional detail	Description	Requirements
112	①	1) Full penetration butt joint.	1) <ul style="list-style-type: none"> <li>- All welds ground flush to plate surface parallel to direction of the arrow.</li> <li>- Weld run-on and run-off pieces to be used and subsequently removed, plate edges to be ground flush in direction of stress.</li> <li>- Welded from both sides, checked by NDT.</li> <li>- For misalignment see NOTE 1.</li> </ul>
100	②	2) Full penetration butt joint.	2) <ul style="list-style-type: none"> <li>- Weld not ground flush</li> <li>- Weld run-on and run-off pieces to be used and subsequently removed, plate edges to be ground flush in direction of Stress.</li> <li>- Welded from both sides.</li> <li>- For misalignment see NOTE 1.</li> </ul>

90	⑦	7) Cruciform joints with load-carrying fillet welds.	7) <ul style="list-style-type: none"> <li>- Weld toe angle ≤60°.</li> <li>- For misalignment see NOTE 1.</li> <li>- See also NOTE 2.</li> </ul>

Figure 4.2 – Extract of Fatigue Class according to EN 1993-1-9 standard, Annex B

## 5 Load Cases

### 5.1 Static loads

The following static load conditions were considered:

Load Cases	Load Condition	Load ( $g = 9.806m/s^2$ )		
		x	y	z
Longitudinal acceleration	S01	+5g	-	-1g
	S02	-5g	-	-1g
Lateral acceleration	S03	-	+1g	-1g
	S04	-	-1g	-1g
Vertical acceleration	S05	-	-	-3g
	S06	-	-	+1g

Table 5.1 – Static load conditions

### 5.2 Fatigue loads

The following fatigue load conditions, and related combinations, were considered:

Load Cases	Load Condition	Load ( $g = 9.806m/s^2$ )		
		x	y	z
Longitudinal acceleration	F01	-0.15g	-	-1g
	F02	+0.15g	-	-1g
Lateral acceleration	F03	-	-0.15g	-1g
	F04	-	+0.15g	-1g
Vertical acceleration	F05	-	-	-1.15g
	F06	-	-	-0.85g

Table 5.2 – Fatigue load conditions

### 5.3 Modal analysis

The modal analysis was carried out, and the natural frequencies of the structure were calculated.

## 6 Boundary conditions

The FE Model was constrained at ground in correspondence of the holes of the plate's frame, and in correspondence of the holes of the low duct, as show in the next figures. In addition, the round gaskets of the fan frames were constrained at ground. These constraints were used in both structural and modal analyses.

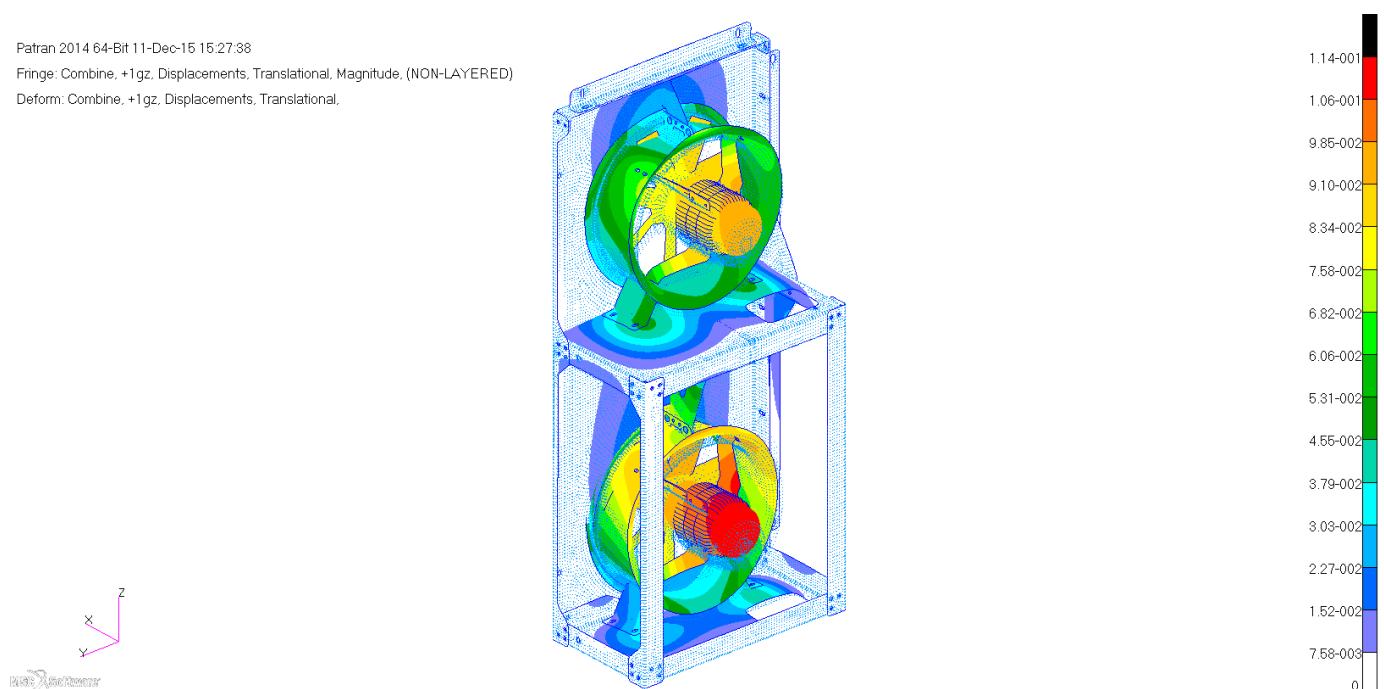

Figure 7.12 – Displacement (magnitude) [mm] for Load Condition S06 (magnification x100)

## **7.7 Static Loads Assessment**

The calculated Von Mises stress is lower than the allowable one ( $R_{p0.2}/1.15=308\text{MPa}$ ) for all load conditions, as shown in the next table.

<b><i>Static Loads Verification</i></b>		
<i>Load condition</i>	<i>Maximum Calculated Von Mises stress [MPa]</i>	<i>Allowable stress [MPa]</i>
S01	271	308 ( $R_{p0.2}/1.15$ )
S02	284	
S03	25	
S04	41	
S05	86	
S06	29	

Table 7.1 – Static Load assessment summary

## 8 Fatigue load conditions results

The results of the fatigue load assessment are summarized in the next table (only the most critical position for each load case is reported), and the significant areas are shown and indicated in the next figures.

For what concerns the welds, the most critical position is always the fillet weld between the fan casing and brackets (FAT of this type of weld is 90, so the butt joints with FAT 100 are verified as well).

One can see that the calculated stress range<sup>1</sup> is always lower than the allowable one.

Fatigue Loads Verification					
Position	Load Cases	Maximum Principal stress [MPa]	Minimum Principal stress [MPa]	Maximum calculated stress range [MPa]	Allowable stress range @ $10^7$ cycles [MPa]
Base Material (FAT 160)	Longitudinal acceleration	13.6	-19.5	33.1	76.0
	Lateral acceleration	29.8	-2.1	31.9	
	Vertical acceleration	32.1	-1.9	34.0	
Load Carrying Fillet weld (FAT 90)	Longitudinal acceleration	8.9	0.0	8.9	42.8
	Lateral acceleration	8.8	0.0	8.8	
	Vertical acceleration	9.8	0.0	9.8	

Table 8.1 – Fatigue Load assessment summary

According to IIW Fatigue Recommendations IIW-1823-07 Dec. 2008 (*Recommendation for fatigue design of welded joints and components*), the stress on the weld toe was determined by the Hot Spot Method, i.e. with a linear extrapolation of the calculated stresses on relevant points (0.4t and 1.0t), as shown in the next figures.

<sup>1</sup> For any point of verification, the stress range is the sum (with sign) of the Maximum and Minimum Principal stresses calculated in that point.

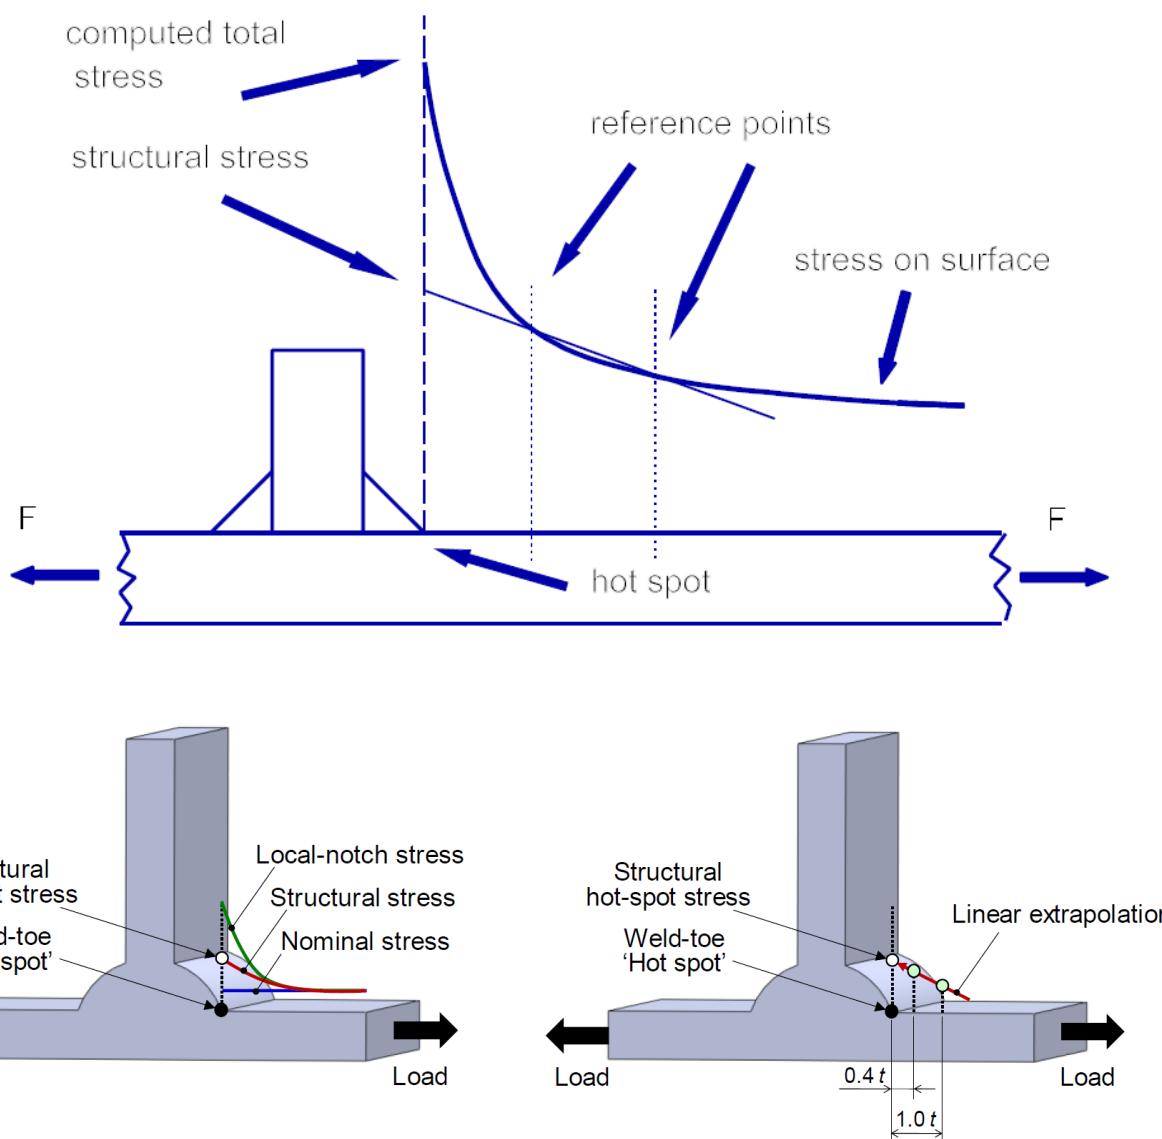

Figure 8.1 – Hot Spot Method<sup>2</sup> (extrapolation of the structural stress at the weld toe)

<sup>2</sup> Figures from *IW Fatigue Recommendations IW-1823-07 Dec. 2008* and paper *Can we optimally design lightweight welded structures with sufficient fatigue resistance?*, Norio Takeda and Tomohiro Naruse, 10<sup>th</sup> World Congress on Structural and Multidisciplinary Optimization.

## 9 Modal analysis results

The first natural frequencies of the model are summarized in the next table.

Mode	Frequency [Hz]	Mode shape
I	23.1	Global Flexural mode
II	37.6	Global Flexural mode
III	40.6	Global Flexural mode

Table 9.1 – Modal analysis result

Piran 2014 64-Bit 14-Dec-15 14:14:55

**Figure 9.3 – Mode III (40.6Hz) - Global Flexural Mode**

## **10 Conclusion**

The stress analysis of the *IND System* was carried out. All verifications (Static and Fatigue load conditions) fulfill with requirements.

A modal analysis was then performed and the first global natural frequency of the structure is 23.1Hz.

### Appendix 1 Forces acting on the Bolts

## **1 Introduction**

This work shows the stress analysis of the *TMB System* built by Comet Fans. According to the Customer design requirements, the design will be checked against static and fatigue loads. The verifications were carried out according to the Customer Specification n.383601 Rev.0.

The FE Model of the *TMB System* was built based on the CAD 3D model provided by Comet Fans, last version according to the 2D drawing SC 227 FEA TMB SYSTEM.

## 2 Software

The Finite Element Model was prepared and the results were analyzed using MSC Patran 2014 pre/post processor, whereas the analyses were performed using MSC Nastran 2013 code.

## 3 FE Model

### 3.1 FE Model description

The FE model, shown in the next figures, is made of:

- 185215 nodes
- 180784 two-dimensional elements (shell elements)
  - 178820 CQUAD4 elements
  - 1964 CTRIA3 elements
- 162 one-dimensional CBAR elements
- 364 Multi Point Constraints RBE2

Screw connections were simplified in the FE Model, and they were modeled through a beam element with suitable cross section, whose ends are connected to the shell by rigid elements.

The mesh of both fans, motors and impellers (components not subjected to verification in this work) was simplified, keeping the inertial properties unchanged.

The global size of the mesh is 10mm. In order to apply the *Hot Spot* method for the stress evaluation on the welds, the size of the mesh was reduced near the weld seams.

The global coordinate system used in this work (shown in the figures), is a rectangular Cartesian coordinate system where x axis is the longitudinal train direction, y axis is the transversal train direction and z axis is the vertical direction train. Measure units are millimeter [mm] for lengths, Newton [N] for forces and second [s] for time.

The calculated mass of the FE model is 564.8kg.

MR002 Rev. 2 dated 12/11/2015

### **3.3 FE Model quality check**

Next Table 3.1 shows the results of quality test carried out on the FE model (the elements that exceed the Nastran verification parameters are not in critical areas).

Type Check	Nastran Tolerance	Number of elements over tolerance	% on Total tria3/quad4 shell elements
<b>Skew angle</b>	< 30°	0	0%
<b>Aspect Ratio</b>	0.5	579	0.32%
<b>Minimum Internal Angle</b>	30°	24	0.01%
<b>Maximum Internal Angle</b>	150°	43	0.02%
<b>Warp Factor</b>	0.05	0	0%

Table 3.1 – FE Model check

### **3.4 Material properties**

Materials and related mechanical properties used in the FE model are summarized in Table 3.2.

Component	Material	Yield Strength [MPa]	Ultimate Tensile Strength [MPa]	Young's Modulus [MPa]	Poisson's Ratio	Density [kg/mm <sup>3</sup> ]
Frame Ducts Impeller Fan frame	S355MC	355	510	206000	0.3	7.9e-6
Motor	Cast Iron	-	-	120000	0.3	7.3e-6
Gasket	EPDM	-	-	10	0.4	1.0e-6

Table 3.2 – Material properties

## 4 Allowable stress values

### 4.1 Static loads

According to EN12663 and Customer Specification n.383601 Rev.0, the allowable stress values for the static loads (the same for welds and base material) are shown in the Table 4.1.

<b>Static Loads Allowable Stress</b>	<b>S355 MC</b>
Yield strength ( $R_{p0.2}/1.15$ )	308 MPa

Table 4.1 – Allowable stress for the static loads

### 4.2 Fatigue loads

The verification for the fatigue loads was carried out according to EN 1993-1-9 standard Annex B (*Fatigue resistance using the geometric - hot spot - stress method*).

The Fatigue Class (FAT, i.e. fatigue limit @  $2 \times 10^6$  cycles) and the allowable stress values (stress range) @  $10^7$  cycles for all details are summarized in the next table (a safety factor of 1.35 was considered).

<b>Fatigue Loads Allowable Stress (stress range)</b> @ $1e7$ cycles – Safety factor $\xi=1.35$			
<b>Material</b>	<b>Detail</b>	<b>FAT</b>	<b>Stress Range</b>
S355 MC	Base material	160	76.0
	Fillet weld	90	42.8

Table 4.2 – Allowable stress for the fatigue loads

Next figures show the fatigue curves for all considered details.

## Technical Report N°1319 - 2015

MR002 Rev. 2 dated 12/11/2015

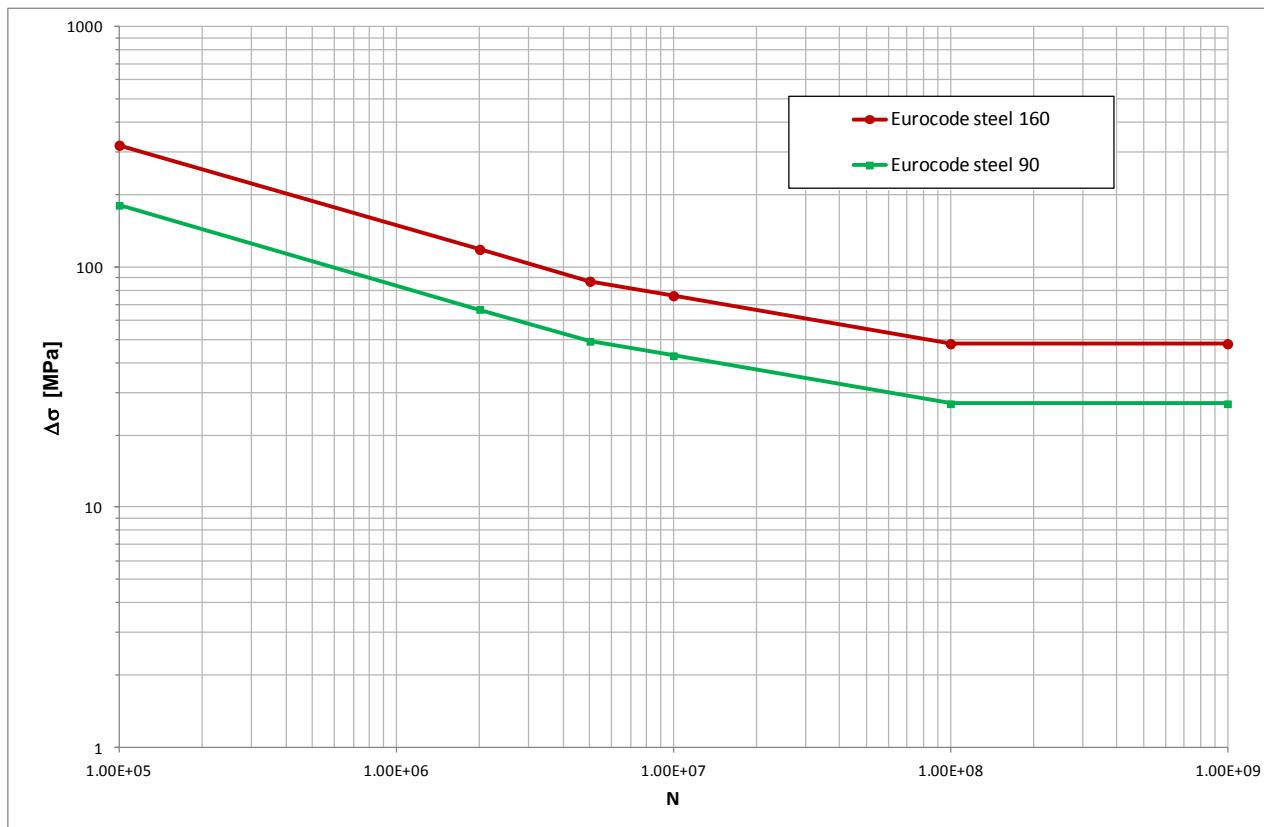

Figure 4.1 – Allowable fatigue strength for steel details (safety factor = 1.35)

Figure 4.2 – Extract of Fatigue Class according to EN 1993-1-9 standard, Annex B

## 5 Load Cases

### 5.1 Static loads

The following static load conditions were considered:

Load Cases	Load Condition	Load ( $g = 9.806m/s^2$ )		
		x	y	z
Longitudinal acceleration	S01	+5g	-	-1g
	S02	-5g	-	-1g
Lateral acceleration	S03	-	+1g	-1g
	S04	-	-1g	-1g
Vertical acceleration	S05	-	-	-3g
	S06	-	-	+1g

Table 5.1 – Static load conditions

### 5.2 Fatigue loads

The following fatigue load conditions, and related combinations, were considered:

Load Cases	Load Condition	Load ( $g = 9.806m/s^2$ )		
		x	y	z
Longitudinal acceleration	F01	-0.15g	-	-1g
	F02	+0.15g	-	-1g
Lateral acceleration	F03	-	-0.15g	-1g
	F04	-	+0.15g	-1g
Vertical acceleration	F05	-	-	-1.15g
	F06	-	-	-0.85g

Table 5.2 – Fatigue load conditions

### 5.3 Modal analysis

The modal analysis was carried out, and the natural frequencies of the structure were calculated.

## 6 Boundary conditions

The FE Model was constrained at ground in correspondence of the holes of the plate's frame, and in correspondence of the holes of the low duct, as show in the next figures. In addition, the round gaskets of the fan frames were constrained at ground. These constraints were used in both structural and modal analyses.

**Technical Report N°1319 - 2015**

MR002 Rev. 2 dated 12/11/2015

## 7.6 Load Condition S06

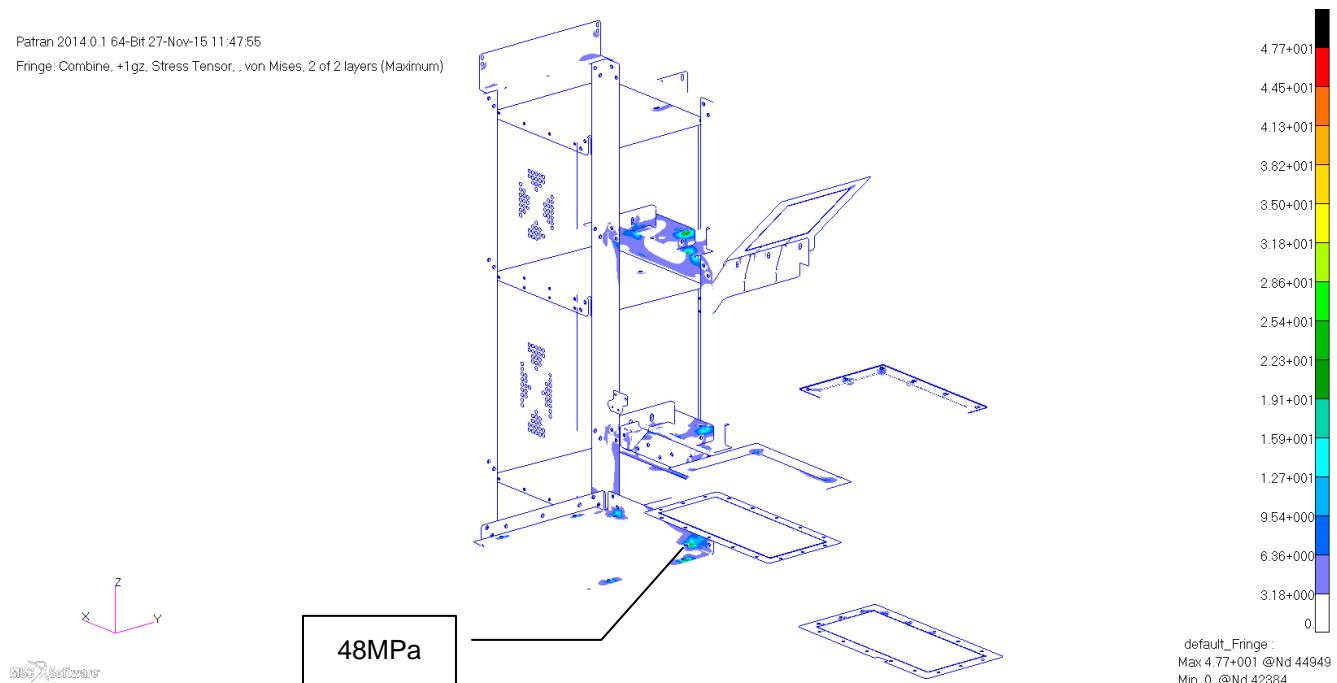

Figure 7.11 – Von Mises stress [MPa] for Load Condition S06

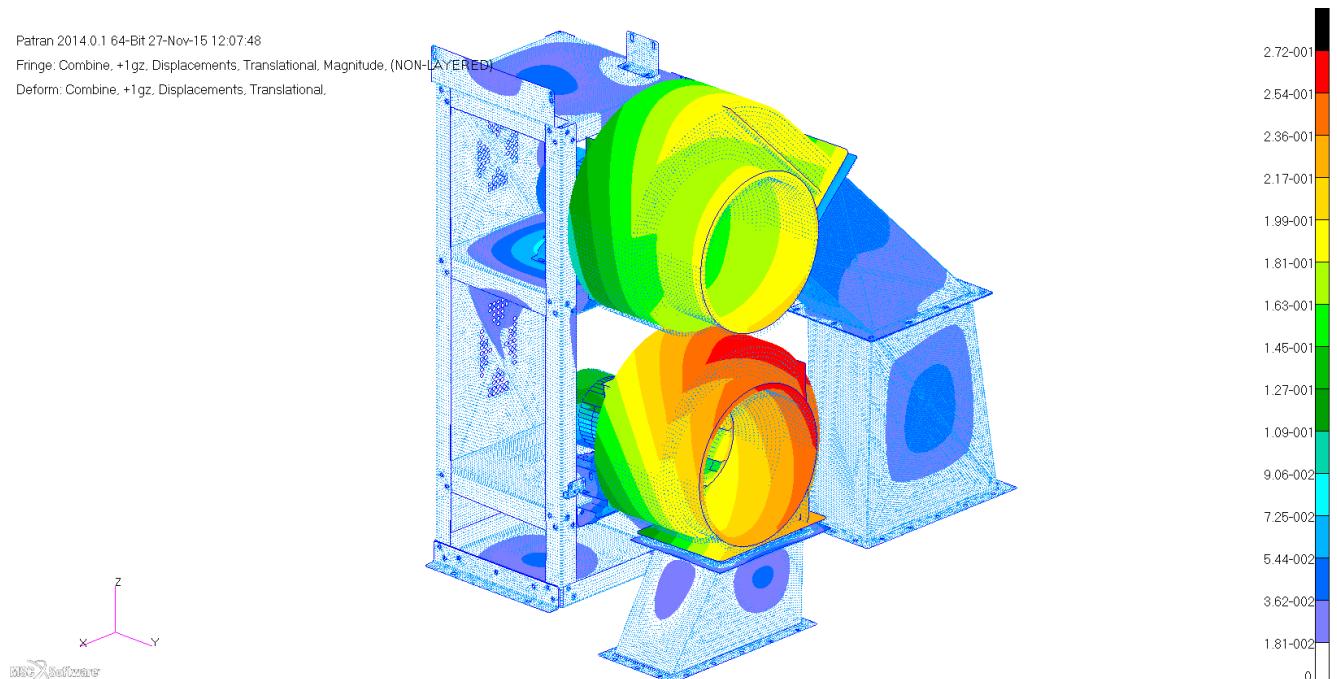

Figure 7.12 – Displacement (magnitude) [mm] for Load Condition S06 (magnification x100)

**Technical Report N°1319 - 2015**
MR002 Rev. 2 dated 12/11/2015

## **7.7 Static Loads Assessment**

The calculated Von Mises stress is lower than the allowable one ( $R_{p0.2}/1.15=308\text{MPa}$ ) for load conditions S03-S06.

For load condition S01 and S02, there are very local areas (near rigid links) where the calculated stress is higher than the allowable one (this condition is allowed by the Customer Specification). As regards these areas, one can observe that a local plastic deformation could be expected, but not high enough to lead to a significant permanent deformation of the structure.

For load conditions S01 and S02, elastic-plastic analyses were performed (see next figures), and the maximum calculated plastic strains were found to be very low (0.03%) compared with the elongation to fracture for this material (22%).

<b><i>Static Loads Verification</i></b>		
<i>Load condition</i>	<i>Maximum Calculated Von Mises stress [MPa]</i>	<i>Allowable stress [MPa]</i>
S01	359	308 ( $R_{p0.2}/1.15$ )
S02	370	
S03	62	
S04	43	
S05	143	
S06	48	
<i>Load condition</i>	<i>Maximum Calculated Plastic Strain</i>	<i>Elongation to fracture</i>
S01	0.03%	22%
S02	0.04%

## 8 Fatigue load conditions results

The results of the fatigue load assessment are summarized in the next table (only the most critical position for each load case is reported), and the significant areas are shown and indicated in the next figures.

For what concerns the welds, the most critical position is always the fillet weld between the fan casing and brackets (FAT of this type of weld is 90, so the butt joints with FAT 100 are verified as well).

One can see that the calculated stress range<sup>1</sup> is always lower than the allowable one.

Fatigue Loads Verification					
Position	Load Cases	Maximum Principal stress [MPa]	Minimum Principal stress [MPa]	Maximum calculated stress range [MPa]	Allowable stress range @ $10^7$ cycles [MPa]
Base Material (FAT 160)	Longitudinal acceleration	33.9	-28.2	62.1	76.0
	Lateral acceleration	37.8	-25.5	63.3	
	Vertical acceleration	41.6	30.8	10.8	
Load Carrying Fillet weld (FAT 90)	Longitudinal acceleration	15.5	0.0	15.5	42.8
	Lateral acceleration	15.0	0.0	15.0	
	Vertical acceleration	16.5	12.1	4.4	

Table 8.1 – Fatigue Load assessment summary

According to IIW Fatigue Recommendations IIW-1823-07 Dec. 2008 (*Recommendation for fatigue design of welded joints and components*), the stress on the weld toe was determined by the Hot Spot Method, i.e. with a linear extrapolation of the calculated stresses on relevant points (0.4t and 1.0t), as shown in the next figures.

<sup>1</sup> For any point of verification, the stress range is the sum (with sign) of the Maximum and Minimum Principal stresses calculated in that point.

 Deform: SC1 MODALE, A1:Mode 7 : Freq. = 26.773, Eigenvectors, Translational, (NON-LAYERED)

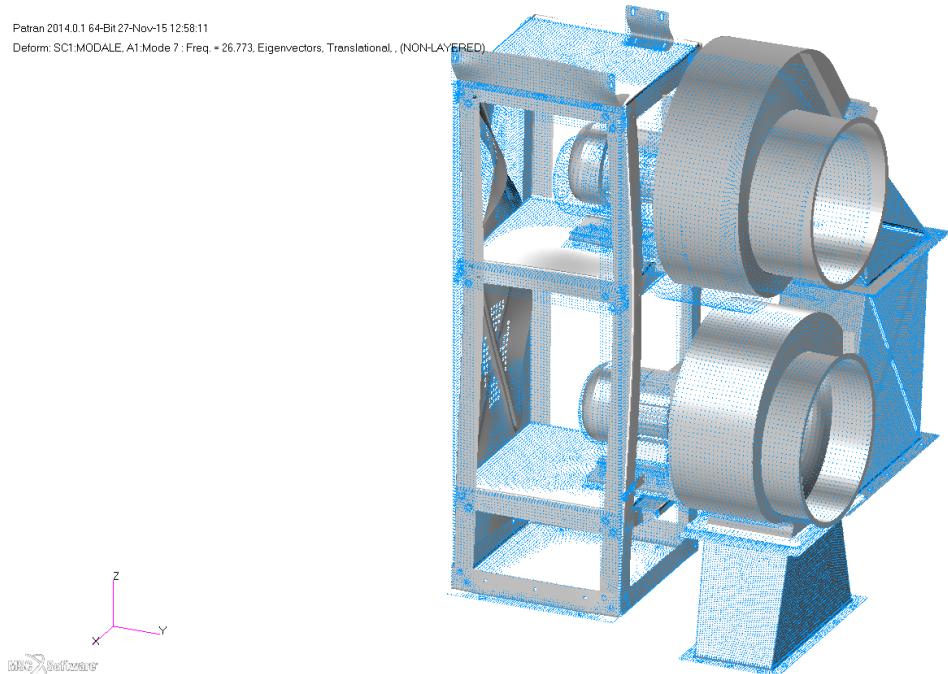

Figure 9.3 – Mode III (26.8Hz) - Global Flexural Mode

## **10 Conclusion**

The stress analysis of the *TMB System* was carried out. All verifications (Static and Fatigue load conditions) fulfill with requirements.

A modal analysis was then performed and the first global natural frequency of the structure is 22.9Hz.

400081	3066	3464	41289	9244	34794	83425	28313	29728	OK	OK	OK
400042	13945	150	41289	9881	28900	83425	28313	29728	NO	OK	OK

#### **4. Conclusion**

All the bolted connections pass the verification, with the exception of item **400042** that does not pass the verification  $F_{v,Ed} \leq F_{s,Rd}$ .

The solution proposed is to use a bigger Bolt M14 instead of M12, and to use a bolt with higher class strength (for example a class A2-80).

ID 400042 A : M14 bolt class A2-70

ID 400042 B : M14 bolt class A2-80

ID	$F_{v,Ed}$	$F_{t,Ed}$	$F_{p,C}$	$F_{s,Rd}$	$F_{b,Rd}$	$N_{net,Rd}$	$F_{v,Rd}$	$F_{t,Rd}$	$F_{v,Ed} \leq F_{s,Rd}$	$F_{v,Ed} \leq F_{b,Rd}$	$F_{v,Ed} \leq N_{net,Rd}$
400042 A*	13945	150	56564	13547	27653	37275	38787	40726	NO	OK	OK
400042 B*	13945	150	64645	15486	27653	37275	44328	46544	OK	OK	OK

The Item id 400042 A does not pass the verification  $F_{v,Ed} \leq F_{s,Rd}$ , because 13945 is higher than 13547 even if only 398N more.
